

The State of Zimbabwe Web Security 2026

What we found assessing 17 Harare businesses across 5 sectors — and what every Zimbabwean business owner should take from it.

17 Businesses assessed	5 Sectors covered	94% Had a fixable vuln	4 Avg findings each
----------------------------------	-----------------------------	----------------------------------	-------------------------------

We ran passive, no-touch assessments — no logins, no port scanning, nothing intrusive. Everything below comes from publicly available information any attacker could see.

What we found

88% Missing critical security headers

71% No privacy policy (DPA 2021 gap)

65% Outdated software / CMS / plugins

47% No HTTPS redirect / weak TLS

41% No SPF/DMARC — email spoofable

24% Exposed admin panel / endpoint

Sectors assessed

Hospitality · Healthcare · Law firms · Schools · NGOs

What to do about it

- Add the core security headers (HSTS, CSP, X-Frame-Options, X-Content-Type-Options).
- Update your CMS, plugins and server software — and keep them updated.
- Publish a privacy policy and force HTTP to redirect to HTTPS.
- Set SPF and DMARC so no one can spoof email from your domain.
- Get a free passive assessment so you know exactly where you stand.
